

CONNECT

Connect is a software-based telephone system which can be run on a low spec personal computer while growing with your business. The system routes telephone calls over the internet at a fraction of the cost of other telephone systems.

This service includes many features available in proprietary PBX systems: voice mail, conference calling, interactive voice response (phone menus), and automatic call distribution.

Connect can run in the cloud or on-site and is currently being used to manage communication for environments of all sizes: from small, one person SOHO businesses, to multi-location corporations and call centres.

The Connect ecosystem provides you with the freedom and flexibility to custom design business communications around your needs.

HOSTING

Dedicated hosting servers give you the flexibility your business needs to implement your customised web solutions. We have various packages available to suit any client's needs.

Linux website hosting servers are secure and affordable and are built on one of many versions of the Linux operating systems.

Because the Linux operating system is distributed freely, it is cheaper than Windows hosting servers - but does not offer the ASP.NET, Microsoft SQL database or Access database features.

Linux hosting does have MySQL databases and support for many platforms and content management systems. View our Linux website hosting plans and sign up for your account today.

Benefits:

- Fully Managed
- Administrator Access
- Daily Backups
- Fast reliable connectivity
- Security
- Proactive monitoring

NEXUS

Nexus offers all the usual CRM functions:

Sales automation

Customer support & service functions, including a customer self-service portal

Marketing automation

Inventory Management

Analysis and reporting

User interaction features include:

Integration with corporate E-mail systems

Support of the Asterisk PBX phone system

Calendaring

Tag cloud functionality

RSS feed subscription

PDF document generation via the TCPDF library

Integration with QuickBooks Accounting Packages,

Magento Shopping Cart

In addition, Nexus features multiple database support, security management and various web forms. The project is available in 22 different languages.

CONSOLIDATE

Consolidate is a backup service which is designed to make your life easier – being both secure and convenient.

Remote Backup Services - keeping your files secure.

Consolidate backup solution allows you to backup your company data to a secure external server or an on-site server, while also allowing others in your department to access data and keep you on the latest version of any file without emailing the file back and forth.

The system lets you control which users may share, edit, delete or view the files.

Accidentally changed a file or deleted it?

No problem, restore a previous version of your files from the website login.

SENTINEL

Sentinel is a monitoring system which checks hosts and services you specify, notifying you when things go wrong and when they recover. It runs on multiple Linux distributions (including Fedora, Ubuntu, and openSuSE) as well as several Unix platforms (including Solaris and HP). The systems to be monitored can be nearly anything connected to a network.

Some of the many features of Sentinel includes:

Monitoring of network services (SMTP, POP3, HTTP, NNTP, PING, etc).

Monitoring of host resources (CPU load, disk usage, etc).

Simple plugin design that allows users to easily develop their own service checks.

Parallel service checks.

Ability to define network host hierarchy using 'parent' hosts, allowing detection of and distinction between hosts that are down and those that are unreachable.

Contact notifications when service or host problems occur and get resolved (via email, pager, or a user-defined method), including detailed reporting of current and historical monitoring data.

Ability to define event handlers to be run during service or host events for proactive problem resolution.

Support for implementing redundant monitoring hosts.

Optional classic web interface for viewing current network status, notification and problem history, log file, etc.
